## Kinetic Molecular Theory

- Explains properties of gases, liquids, and solids in terms of energy using an ideal gas, an imaginary which fits all the assumptions of kinetic molecular theory

## Assumptions of Kinetic Molecular Theory:

1. Gas particles are in $\qquad$
2. The $\qquad$ of the gas particles is
$\qquad$ compared to the distance between
 gas particles. Therefore, gases are $\qquad$
3. There are $\qquad$ between gas particles.
4. Elastic collisions occur between molecules during collisions, meaning there is $\qquad$ during collisions
5. The $\qquad$ of the molecules is proportional to the absolute $\qquad$ of the gas.

***Note: An IDEAL GAS is THEORETICAL and is used to PREDICT the behavior of REAL GASES ( $\mathrm{O}_{2}, \mathrm{H}_{2}$, He, etc.). The ASSUMPTIONS above are not true of REAL GASES.

## Problems with KMT:

1. Gas atoms/molecules do take up space (gases are a type of matter after all)
2. Some intermolecular forces do exist between gas molecules
3. Collisions are not perfectly elastic.

## Conditions in which a REAL GAS behaves MOST like an IDEAL GAS:

1. $\qquad$ (moves around more freely)
2. $\qquad$ (fast moving)
3. $\qquad$ (not attracted to each other )
4. $\qquad$
5. $\qquad$ (more space to move, less likely to collide)

## Physical Characteristics of Gases:

- Gases do not have a definite shape or volume; they $\qquad$
- Gases have $\qquad$
- Gases can be $\qquad$

## Variables that Define Gases

- $\qquad$ - how much space a gas takes up; may be expressed in liters, milliliters, $\mathbf{c m}^{\mathbf{3}}, \mathbf{d m}^{\mathbf{3}}$.

## -

to convert between ${ }^{\circ} \mathrm{C}$ and Kelvin, you can use the following formula (yes you must know it!):

$$
\begin{array}{rl}
\mathrm{K}={ }^{\circ} \mathrm{C}+273 & \mathrm{~K}
\end{array}=\text { kelvin } .
$$

## Temperature Conversion Examples:

1. The temperature of the room was measured to be $25^{\circ} \mathrm{C}$. What is this temperature in Kelvins?
2. If the boiling point of a substance was measured to be 300 K , what is this temperature in ${ }^{\circ} \mathrm{C}$ ?
$\qquad$ - how many particles are present in the sample of gas
$\qquad$ -the force per unit area on a surface

- Exerted by all gases on any surface they collide with
- $\qquad$ cause pressure!
- Units of Pressure: Pascal $=\mathrm{Pa}$ (SI unit of pressure); Millimeter of mercury $=\mathrm{mmHg}$ (used in a barometer); Torr = torr; Atmosphere = atm (pressure of the atmosphere at sea level=1atm)

## $1 \mathrm{~atm}=$

## Pressure Conversion Examples:

1. What is the pressure in torr of 345 mmHg ?
2. What is the pressure in atm of 123 kPa ?

## Measuring Pressure

## Barometer

- used to measure $\qquad$
- The $\qquad$ the $\qquad$
$\qquad$ and the $\qquad$
the height of the mercury in the thermometer

## Manometer-

- measures the pressure of an enclosed sample
- Can be open or closed

- Gas pressure is $\qquad$ than
atmospheric (air) pressure when the
height of the liquid in the manometer is
higher on the $\qquad$ .
Therefore you will $\qquad$
the height and the atmospheric pressure.

Open Manometer
(b)

- Gas pressure is $\qquad$ than atmospheric (air) pressure when the height of the liquid in the manometer is higher on the $\qquad$ .
Therefore you will
the height and the atmospheric pressure.

## Examples:

If the atmospheric (air) pressure is 757.8 mmHg , what is the pressure of the gas in each of the following manometers?

## PRACTICE:

Convert the following temperatures.

1. Convert $32^{\circ} \mathrm{C}$ to Kelvin
2. Convert $12^{\circ} \mathrm{C}$ to Kelvin
3. Convert 450 K to ${ }^{\circ} \mathrm{C}$

Convert the following pressures.

1. What is pressure of 1.45 atm in torr?
2. What is the pressure of 645 mmHg in kPa ?
3. What is the pressure of 890 torr in Pa ?

Calculate the pressure for each gas in the following open manometers.
1.

(a)
2.

(a)
3.

4.

Gas Laws Summary Table

| Name of Law | Equation/Definition | Type of Relationship | Constant |
| :---: | :---: | :---: | :---: |
| Dalton's Law |  | ---- | ---- |
| Graham's Law |  |  | --- |
| Boyle's Law |  |  | T |
| *Charles' Law |  |  | P |
| *Gay- <br> Lussac's <br> Law |  |  | V |
| *Combined Gas Law |  | ---- | ---- |
| Avogadro's Law |  |  | ---- |
| *Ideal Gas Law |  | ---- | $\begin{aligned} R & =0.0821 \frac{\mathrm{~atm} \cdot \mathrm{~L}}{\mathrm{~mol} \cdot \mathrm{~K}} \\ & =8.315 \frac{\mathrm{kPa} \cdot \mathrm{~L}}{\mathrm{~mol} \cdot \mathrm{~K}} \end{aligned}$ |

*Note: TEMPERATURES MUST BE IN KELVIN!!!

## $\underline{S T P}=$

## Dalton's Law of Partial Pressures

- Each individual gas behaves as if it were independent of the others.
- The total pressure of a mixture of gases equals the sum of the pressures that each would exert if it were present alone.

$$
\mathbf{P}_{\text {total }}=
$$

- When one collects a gas over water, there is water vapor mixed in with the gas.
- To find only the pressure of the desired gas, one must subtract the vapor pressure of water from the total pressure ( $\mathrm{P}_{\mathrm{H} 2 \mathrm{O}}$ taken from table based on temperature)

$$
\mathbf{P}_{\text {total }}=
$$

- The mole fraction of an individual gas component in an ideal gas mixture:

$$
\mathbf{x}_{\mathbf{i}}=
$$

- The partial pressure of an individual gas component in an ideal gas:

$$
\mathbf{P}_{\mathbf{i}}=
$$

$\mathbf{x}_{\mathbf{i}}=$ mole fraction of any individual gas component in a gas mixture
$\mathbf{P}_{\mathbf{i}}=$ partial pressure of any individual gas component in a gas mixture
$\mathbf{n}_{\mathbf{i}}=$ moles of any individual gas component in a gas mixture
$\mathbf{n}=$ total \# moles of the gas mixture
$\mathbf{P}=$ total pressure of the gas mixture

## Examples:

1. Two gases such as oxygen and nitrogen are present in a flask at the following pressures. When combined, what is the pressure of the flask?

$$
P_{\text {Nitrogen }}=250 . \mathrm{mm} \mathrm{Hg} \quad P_{\text {Oxygen }}=300 . \mathrm{mm} \mathrm{Hg}
$$

2. Neon gas has a pressure of 1.49 atm in its container. When added to a container holding helium gas the total pressure is 2.34 atm . What is the pressure of the helium gas?
3. Oxygen gas from the decomposition of potassium chlorate was collected by water displacement. The barometric pressure and the temperature during the experiment were 731.0 torr and $20.0^{\circ} \mathrm{C}$ respectively. What was the partial pressure of the oxygen collected? The vapor pressure of water at $20^{\circ} \mathrm{C}$ is 17.5 torr
4. A $250 . \mathrm{mL}$ sample of oxygen is collected over water at $25^{\circ} \mathrm{C}$ and 760.0 torr pressure. What is the pressure of the dry gas alone? (vapor pressure of water at $25^{\circ} \mathrm{C}=23.8$ torr)
5. A tank contains 480.0 grams of oxygen and 80.00 grams of helium at a total pressure of 7.00 atmospheres. Calculate the following.
a. How many moles of $\mathrm{O}_{2}$ are in the tank?
b. How many moles of He are in the tank?
c. Total moles of gas in tank.
d. Mole fraction of $\mathrm{O}_{2}$.
e. Mole fraction of He.
f. Partial pressure of $\mathrm{O}_{2}$.
g. Partial pressure of He .
6. A mixture of 14.0 grams of hydrogen, 84.0 grams of nitrogen, and 2.0 moles of oxygen are placed in a flask. When the partial pressure of the oxygen is 78.00 mm Hg , what is the total pressure in the flask?
$\qquad$ at which different gases diffuse (spread out) are

## Examples:

1. Compare the rates of diffusion of $\mathrm{H}_{2}$ and $\mathrm{O}_{2}$ gases at the same temperature and pressure.
2. Rank the following gases from slowest to fastest rate of diffusion: $\mathrm{H}_{2}, \mathrm{CO}_{2}, \mathrm{Ne}, \mathrm{H}_{2} \mathrm{~S}$.
3. Quantitatively compare the rate of effusion of carbon dioxide with hydrochloric acid at the same temperature and pressure.
4. A sample of hydrogen gas effuses through a porous container about 9 times faster than an unknown gas. Estimate the molar mass of the unknown gas.
5. If a molecule of neon gas travels at an average of $400 \mathrm{~m} / \mathrm{s}$ at a given temperature, estimate the average speed of a molecule of butane gas, $\mathrm{C}_{4} \mathrm{H}_{10}$, at the same temperature

Gas Laws: Molecular Explanations

| Gas Law | Explain what is happening on a MOLECULAR level |
| :--- | :--- |
| Boyle's Law |  |
| Charles' Law |  |
| Gay-Lussac's <br> law |  |

## Gas Laws: Calculations

1. A 12.3 L sample of helium fills a weather balloon at $20.0^{\circ} \mathrm{C}$. What would the volume change to if the weather balloon cooled to $-12.0^{\circ} \mathrm{C}$ as it rose in the atmosphere?
2. A tire has a volume of 67.3 L at a pressure of 3.0 atm . What would the volume be if the pressure were increased to 3.5 atm ?
3. A sample of methane occupies 445.9 mL at $75 .{ }^{\circ} \mathrm{C}$. At what temperature would it have a volume of 323.8 mL ?
4. A sample of gas has a volume of 74.3 mL at a pressure of 106.8 kPa . What would the pressure be if the volume is increased to 113.5 mL ?
5. A helium balloon has a volume of 8.09 L at STP. What volume would it have as it rose in the atmosphere if the pressure decreased to 89.7 kPa and the temperature decreased to $-10.0^{\circ} \mathrm{C}$ ?

## Avogadro's Law

- The $\qquad$ of a gas at constant temperature and pressure is $\qquad$
$\qquad$ of the gas.
$\qquad$ of gases at the same pressure and temperature contain the
$\qquad$ and molecules

## - 1 mole of any gas at STP is 22.4 L

Ex:

1. At STP, what is the volume of 7.08 mol of nitrogen gas?
2. If 1.0 mole of nitrogen has a volume of 22.4 L at STP, what volume would 5.0 g of $\mathrm{N}_{2}$ occupy at STP?

## Ideal Gas Law

$$
R=0.0821 \frac{\mathrm{~atm} \cdot \mathrm{~L}}{\mathrm{~mol} \cdot \mathrm{~K}}=8.315 \frac{\mathrm{kPa} \cdot \mathrm{~L}}{\mathrm{~mol} \cdot \mathrm{~K}}=62.4 \frac{\mathrm{mmHg} \cdot \mathrm{~L}}{\mathrm{~mol} \cdot \mathrm{~K}}
$$

- Describes the state of a hypothetical ideal gas.
- Good approximation of the behavior of many gases under many conditions.
- To determine which R to use in your equation you have to look at the Ex:

1. What volume would 4.5 mole of hydrogen occupy at $25^{\circ} \mathrm{C}$ and 1.046 atm ?
2. A balloon has a volume of 2.34 L , and is at $47.5^{\circ} \mathrm{C}$ and 98.2 kPa .
a. How many moles of Helium are
b. How many grams of Helium are contained in the balloon?
3. At $28^{\circ} \mathrm{C}$ and $0.974 \mathrm{~atm}, 1.00 \mathrm{~L}$ of a gas has a mass of 5.16 g .
a. How many moles of gas are present?
b. What is the molar mass of this gas?
4. What mass of methane would occupy 3.00 L at STP?
